DETAILED ACTION

This application filed July 6, 2001, claims benefit to provisional applications 60/216,104, filed July 6, 2000, and 60/223,386, filed August 7, 2000.

Applicants' amendment containing the sequence listing filed December 31, 2001, paper number 4, has been received and entered. The specification has been amended. Claims 1-25 are pending and currently under examination.

Election/Restriction

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1-12, 17-23, drawn to a targeting construct comprising a polynucleotide sequence homologous to the sequence encoding protein phosphatase 2C and a selectable marker and the transgenic animal generated with said construct, and method of producing said construct, classified in class 536, subclass 23.1; class 800, subclass 8; class 800, subclass 21; class 800, subclass 3..
- II. Claims 13-15 and 24, drawn to method of identifying an agent which modulates activity of protein phosphatase 2C in a cell comprising a disruption in a phosphatase 2C gene, classified in class 435, subclass 325.

Art Unit: 1632

- III. Claims 16 and 25, drawn to an agent which modulates the expression of protein phosphatase 2C, unclassifiable because the nature of the agent is not specifically set forth.

The inventions are distinct, each from the other because of the following reasons:

Inventions I -III are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case the different inventions are drawn to different and separate products and methods which are materially different and capable of separate use. Specifically, the polynucleotide sequences and the animals can be used for *in vivo* assays to measure a physiological effect on an entire tissue or animal and the cells can be obtained separate from generating an animal and can be used for *in vitro* assays to study specific molecular signaling. The agent encompassed by group III is not clearly defined and could be identified by other methods and could be used in other assays. Each of Groups I-III are drawn to materially different inventions and would require a separate search and consideration.

Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification, and recognized divergent subject matter, restriction for examination purposes as indicated is proper.
